Land abandonment

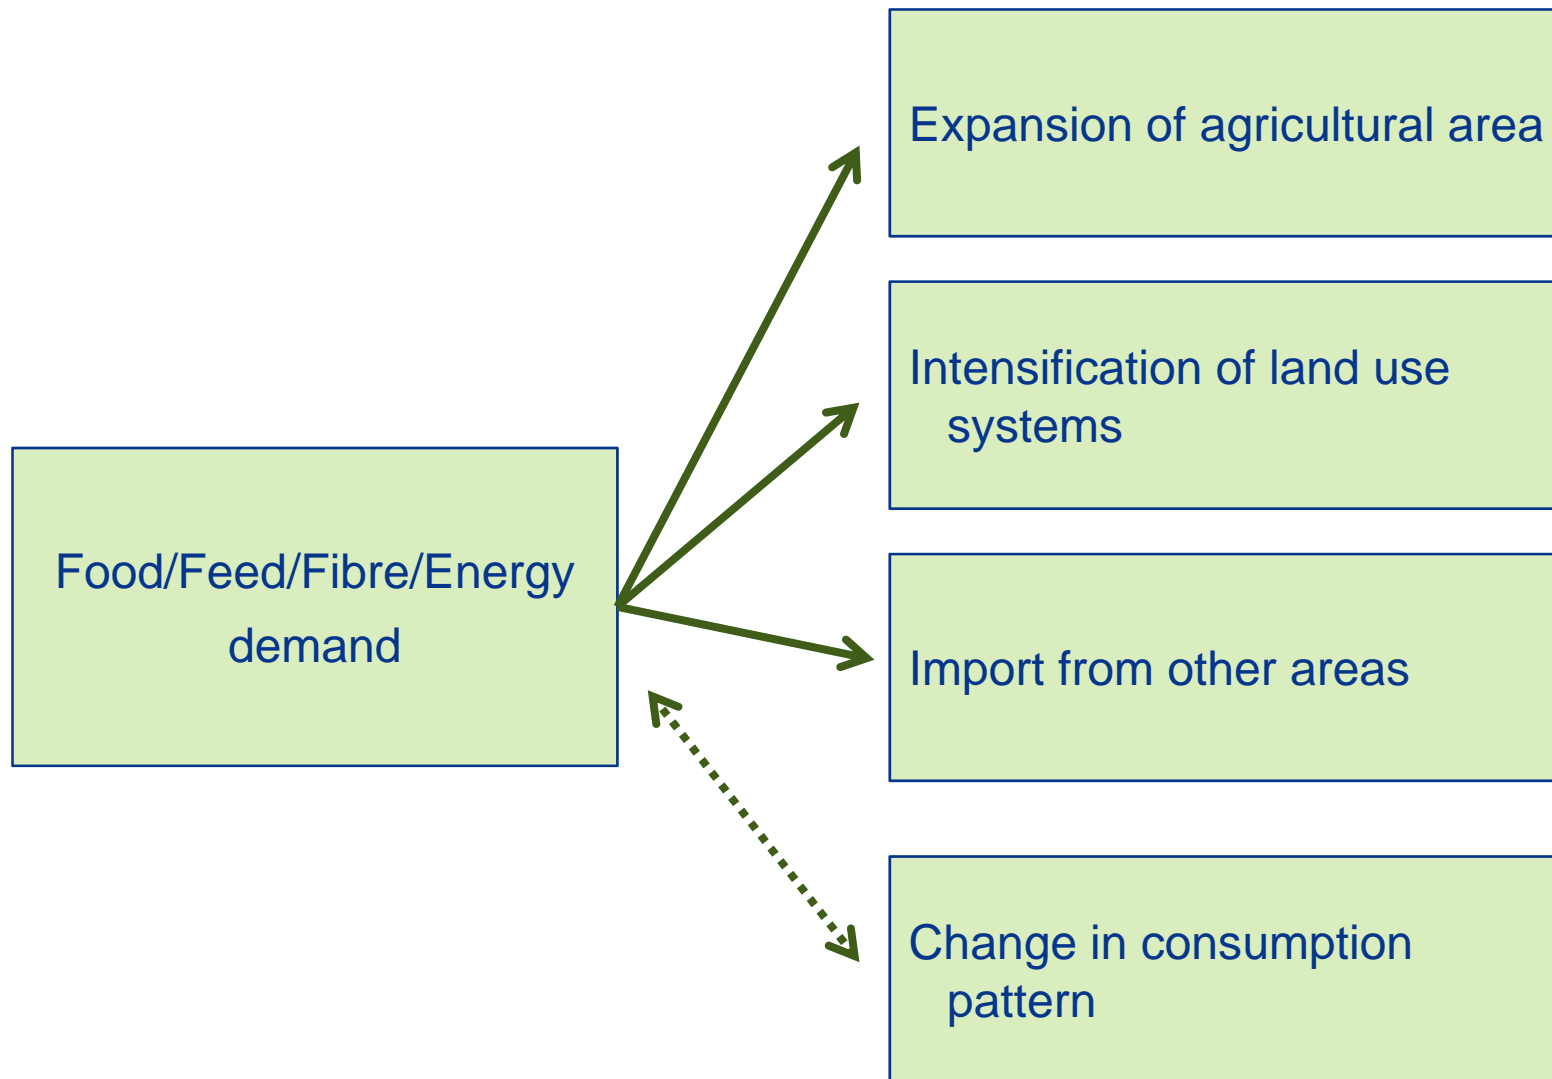

Local land change in a telecoupled world

Telecoupling

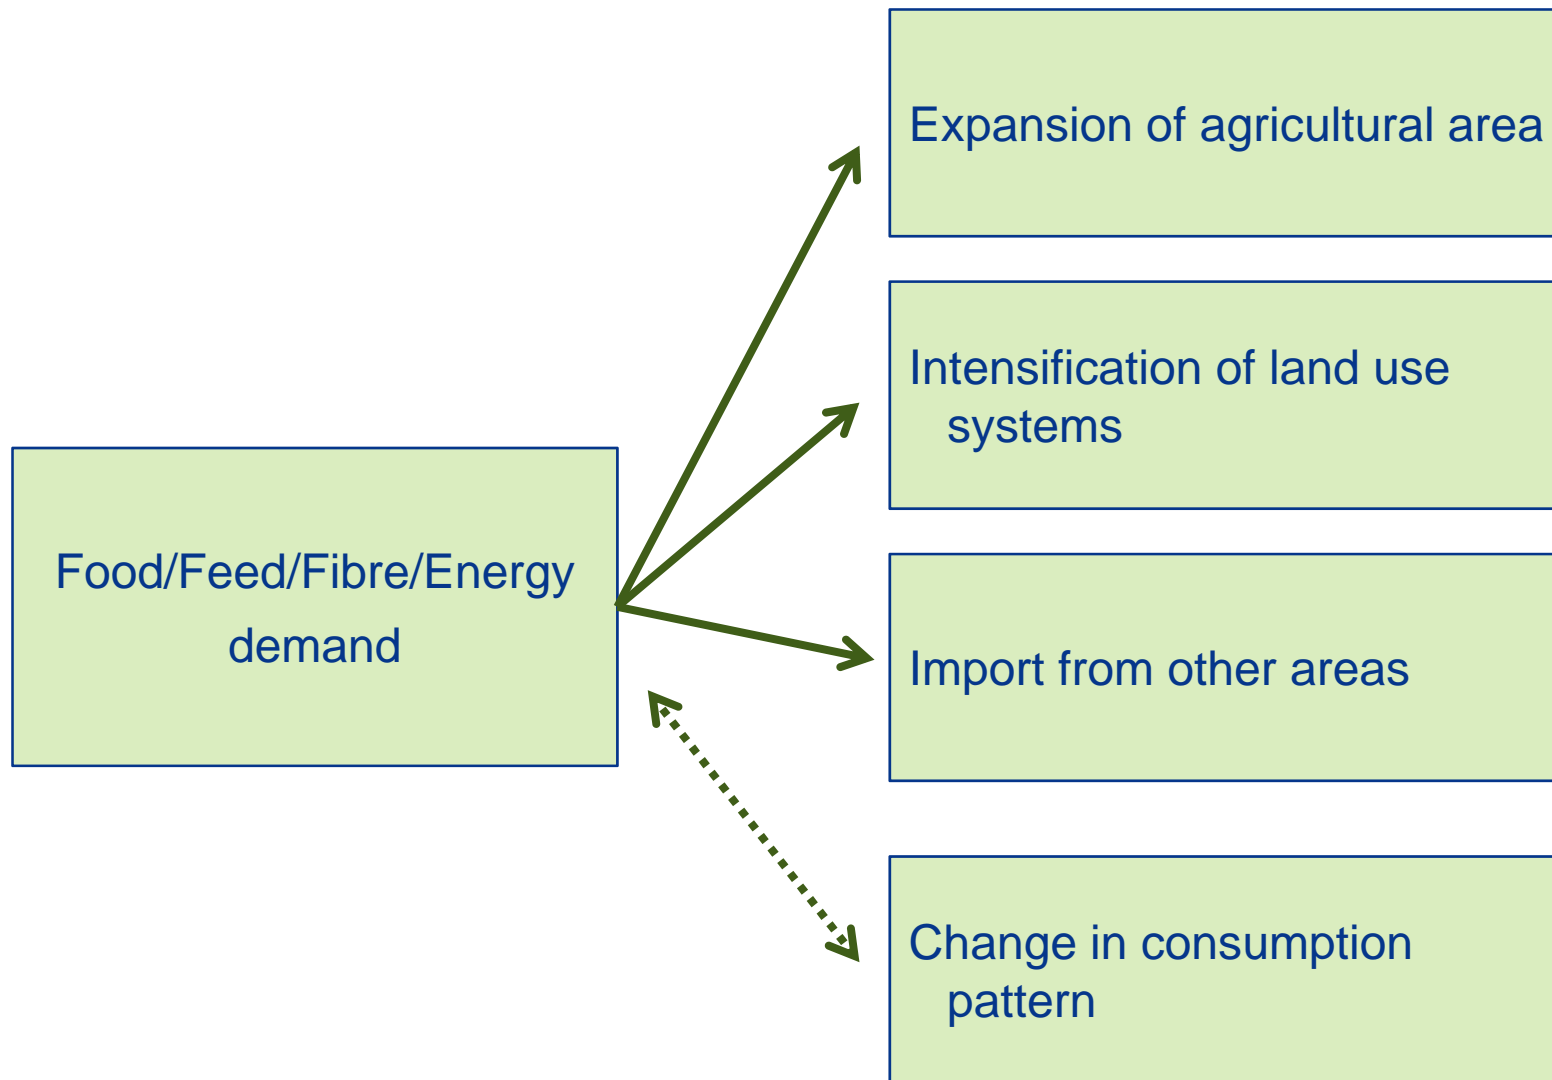

Agricultural production

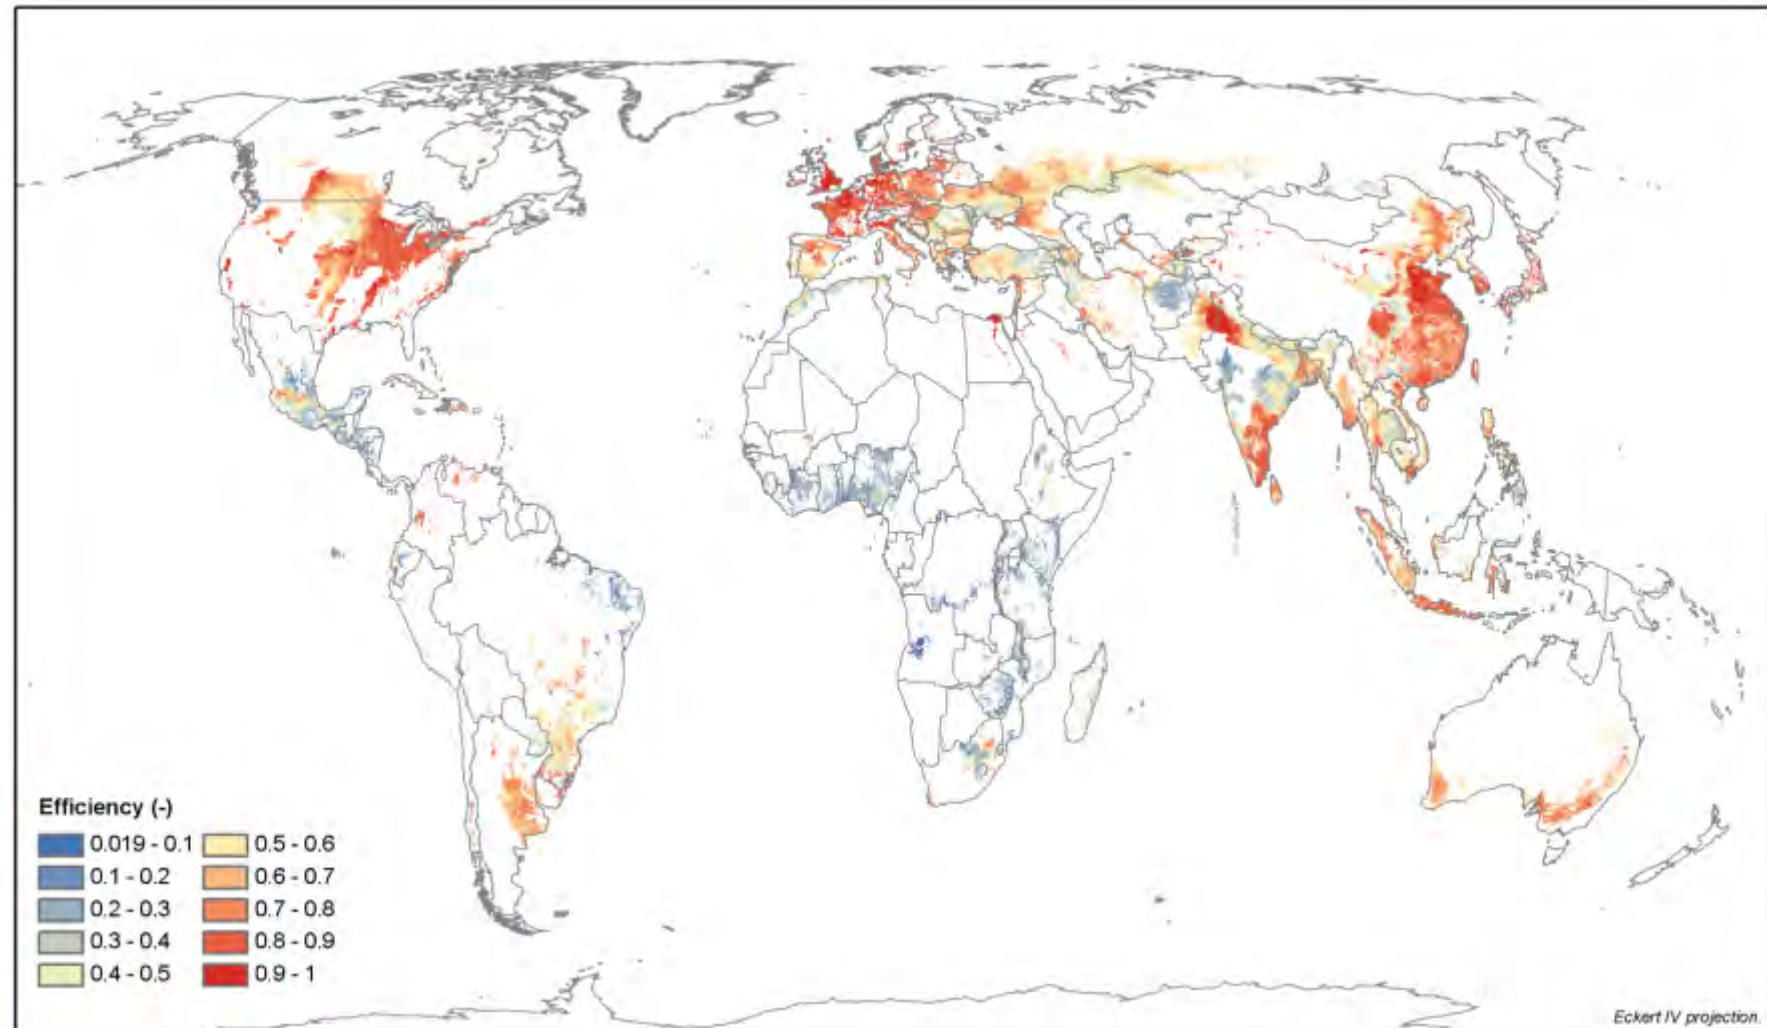

Expansion: land cover change

Food security

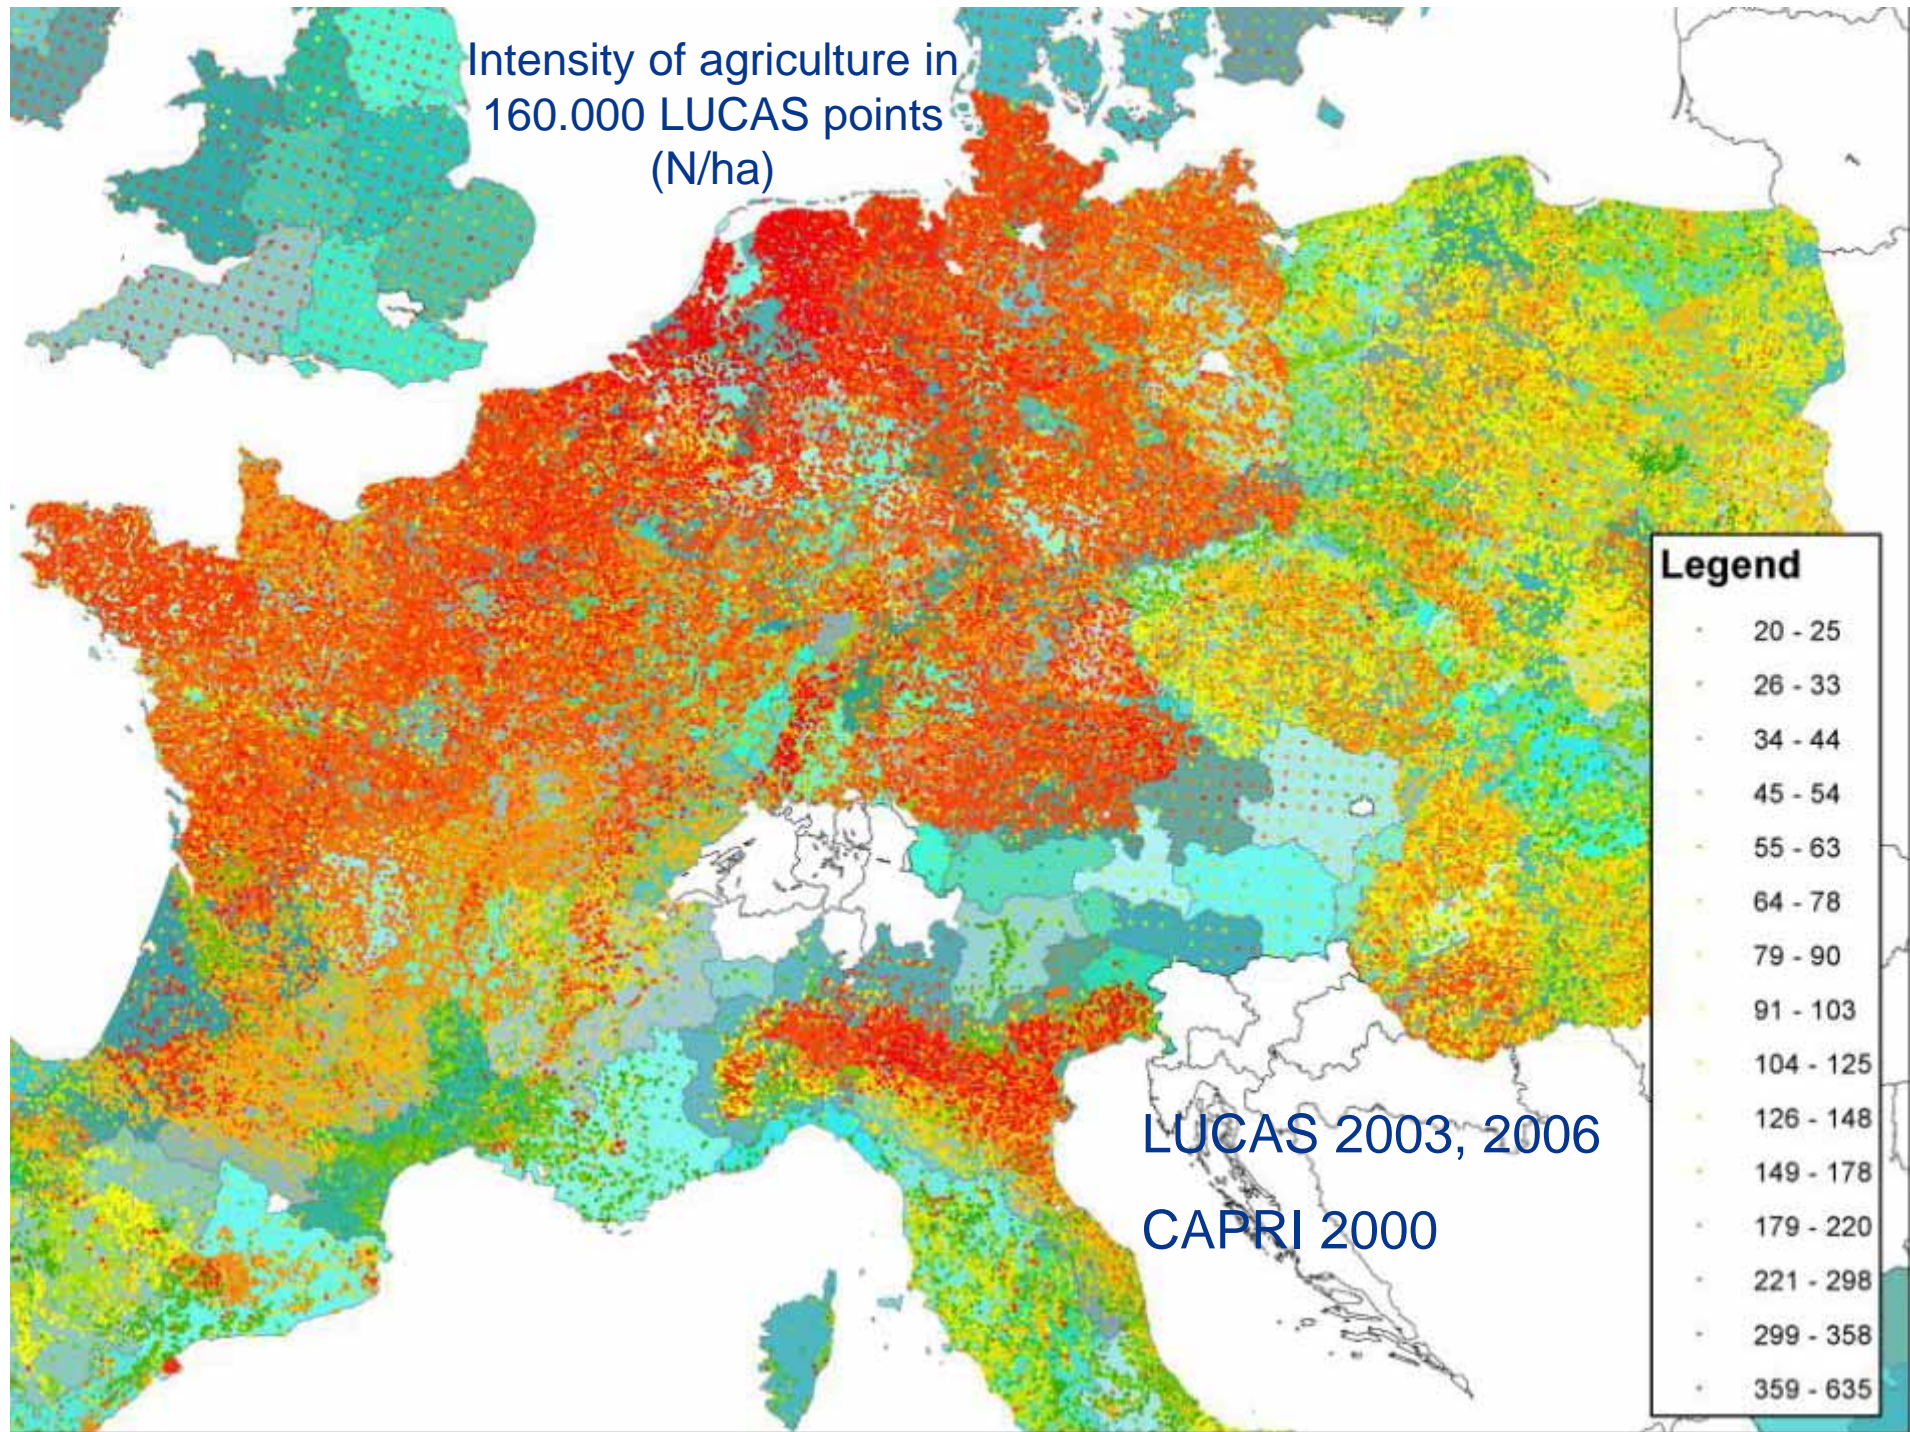

Agricultural intensity (cropland areas)

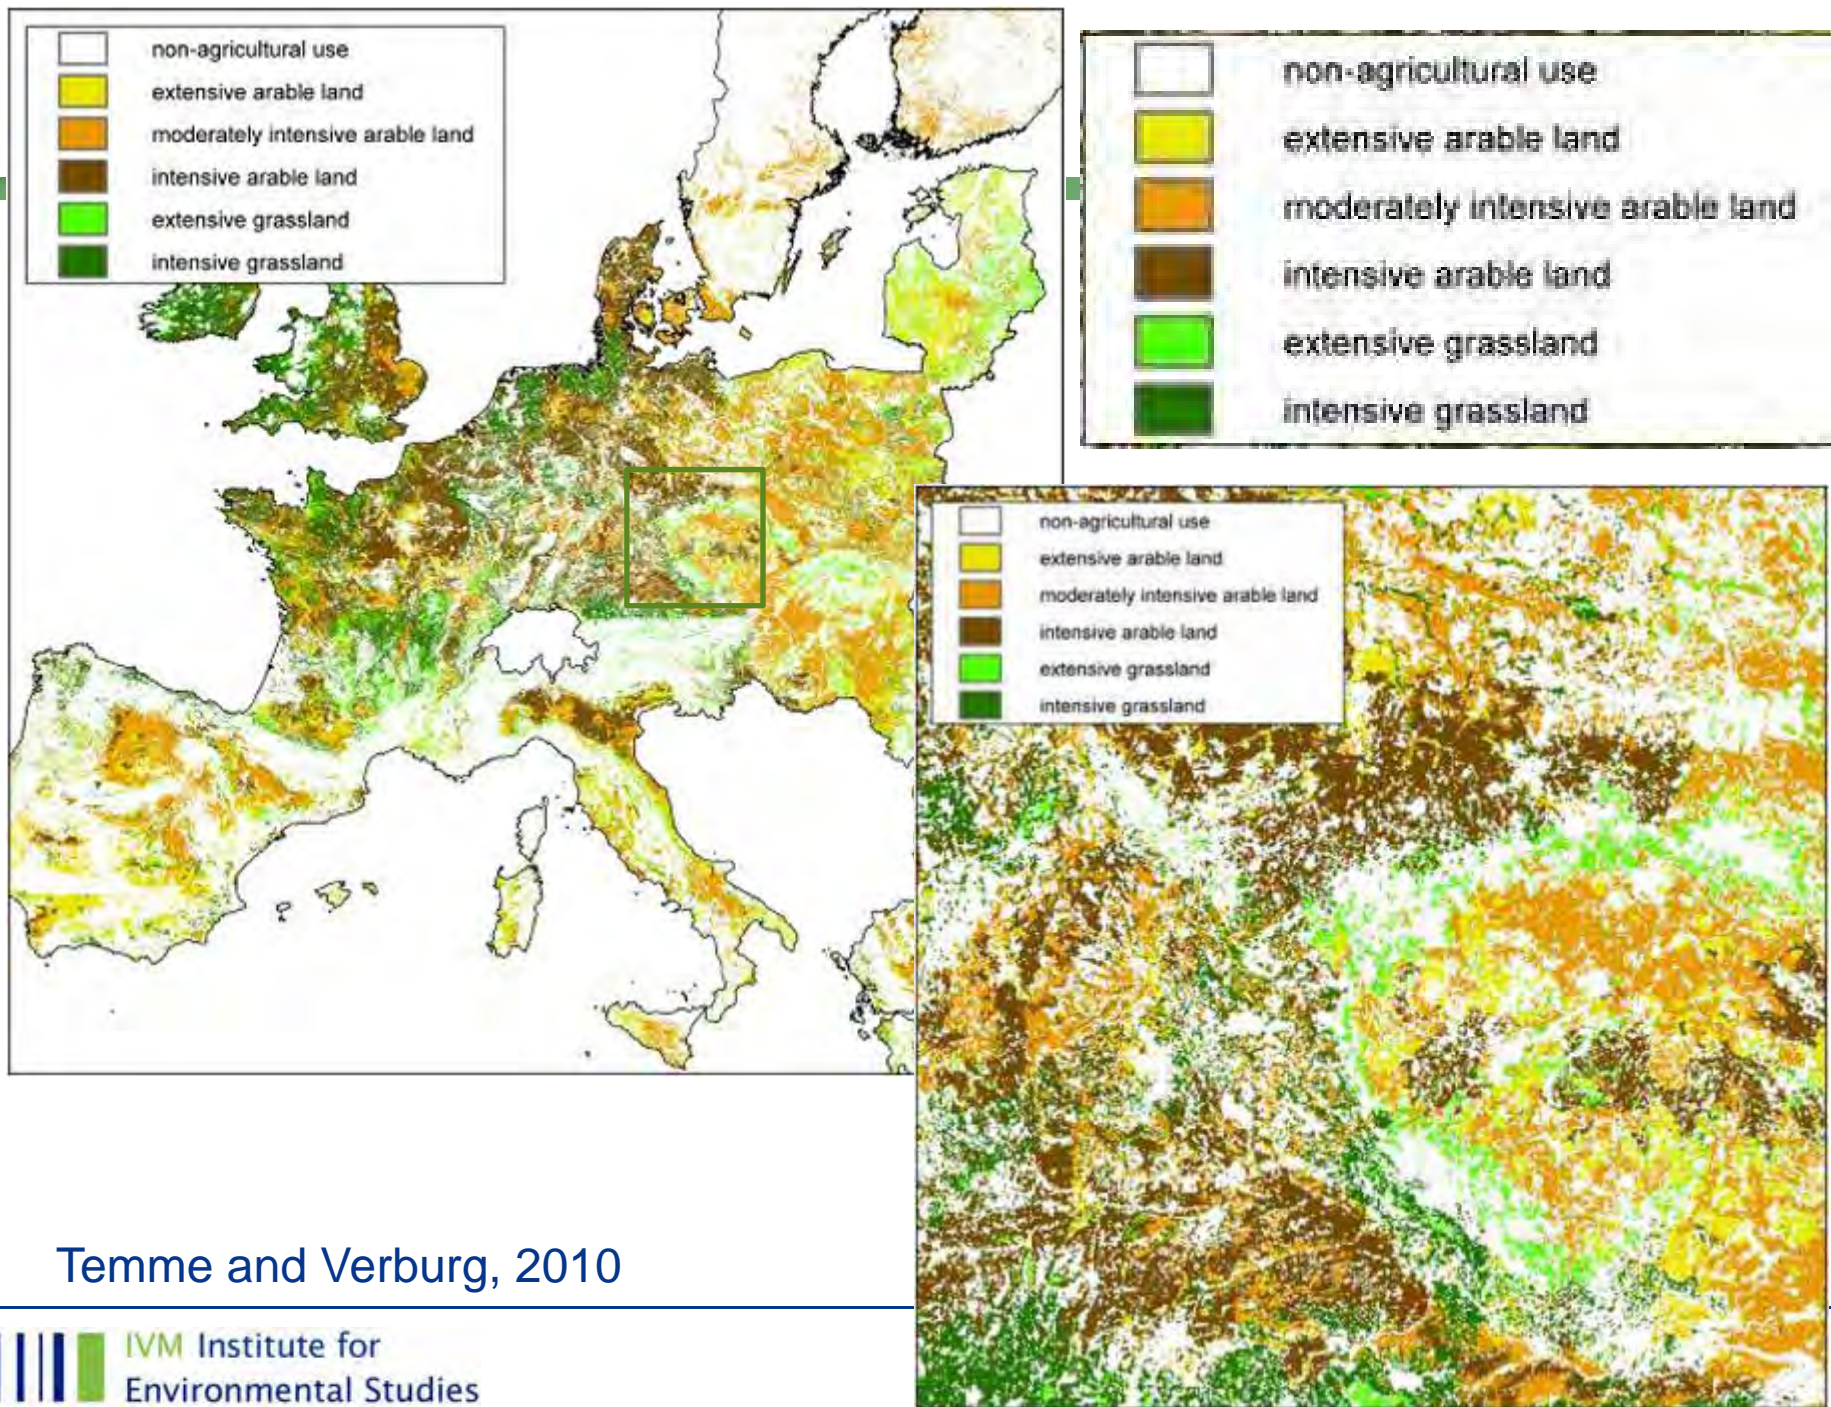

Based on Neumann et al. (2010), *Agricultural Systems* 103, 316-326.

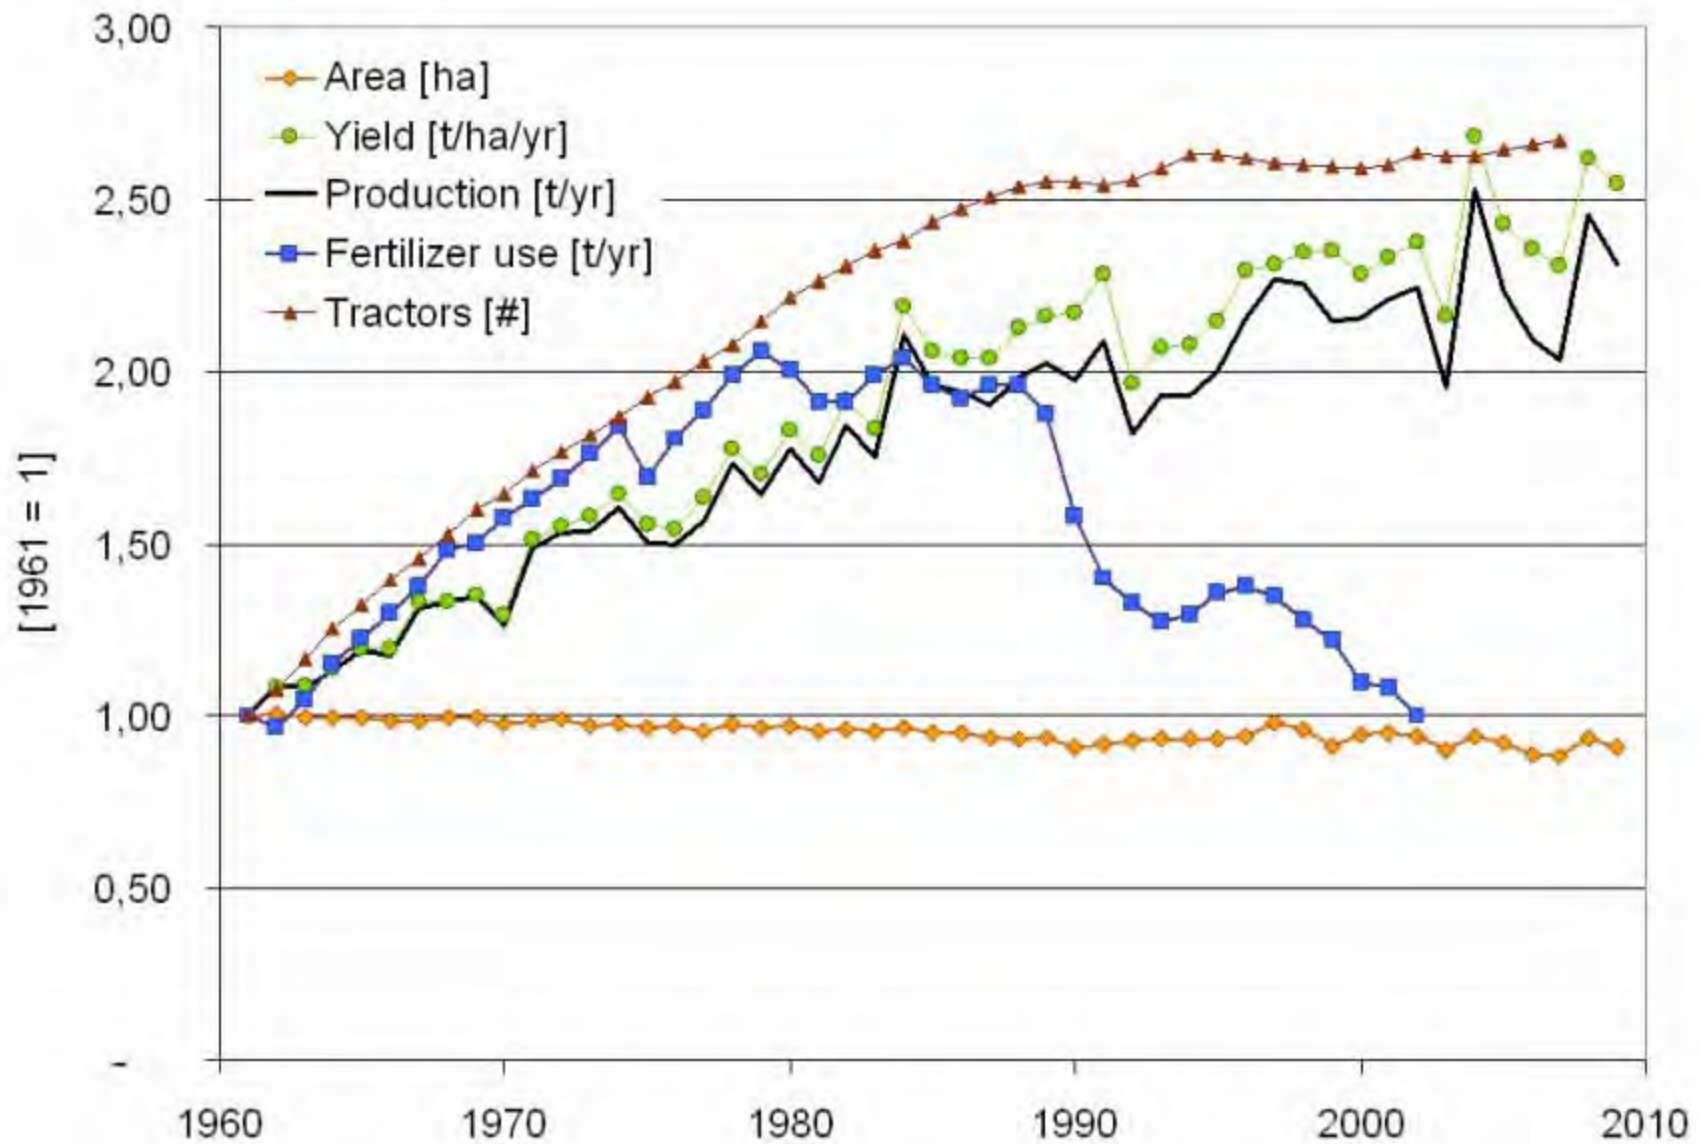

Intensity of agriculture in
160.000 LUCAS points
(N/ha)

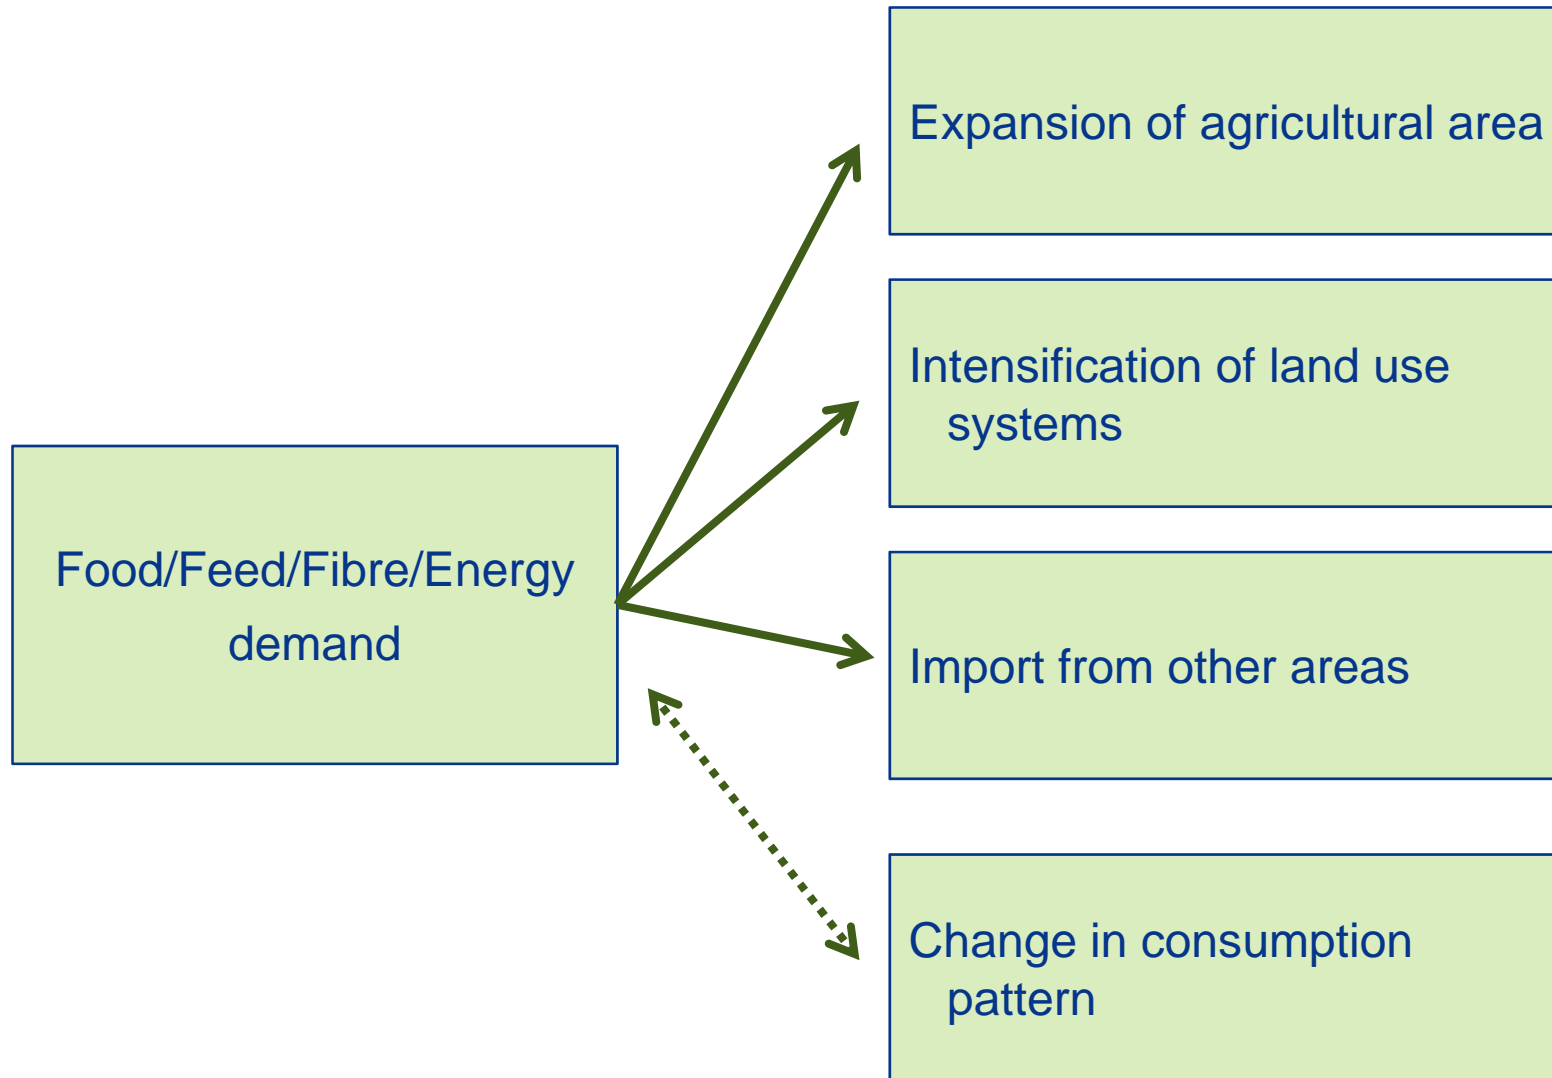

LUCAS 2003, 2006
CAPRI 2000

Temme and Verburg, 2010

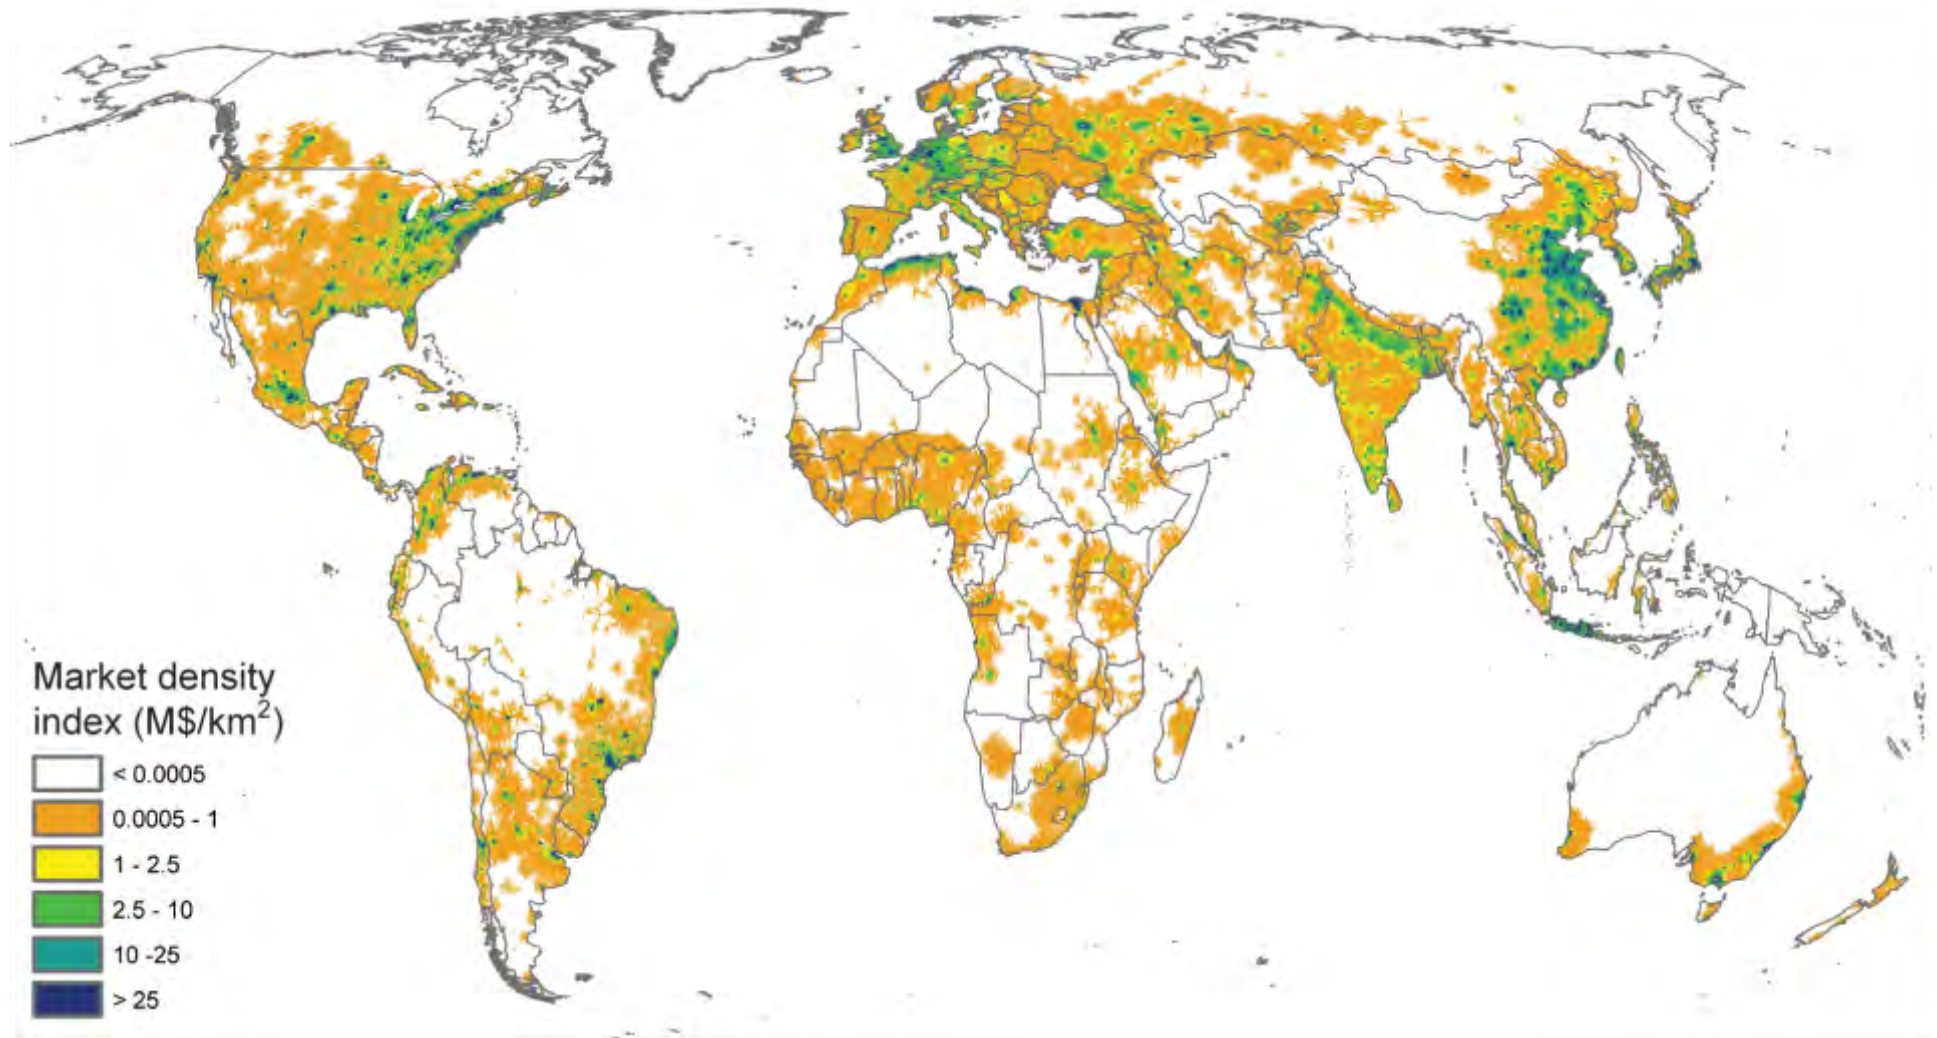

Food security

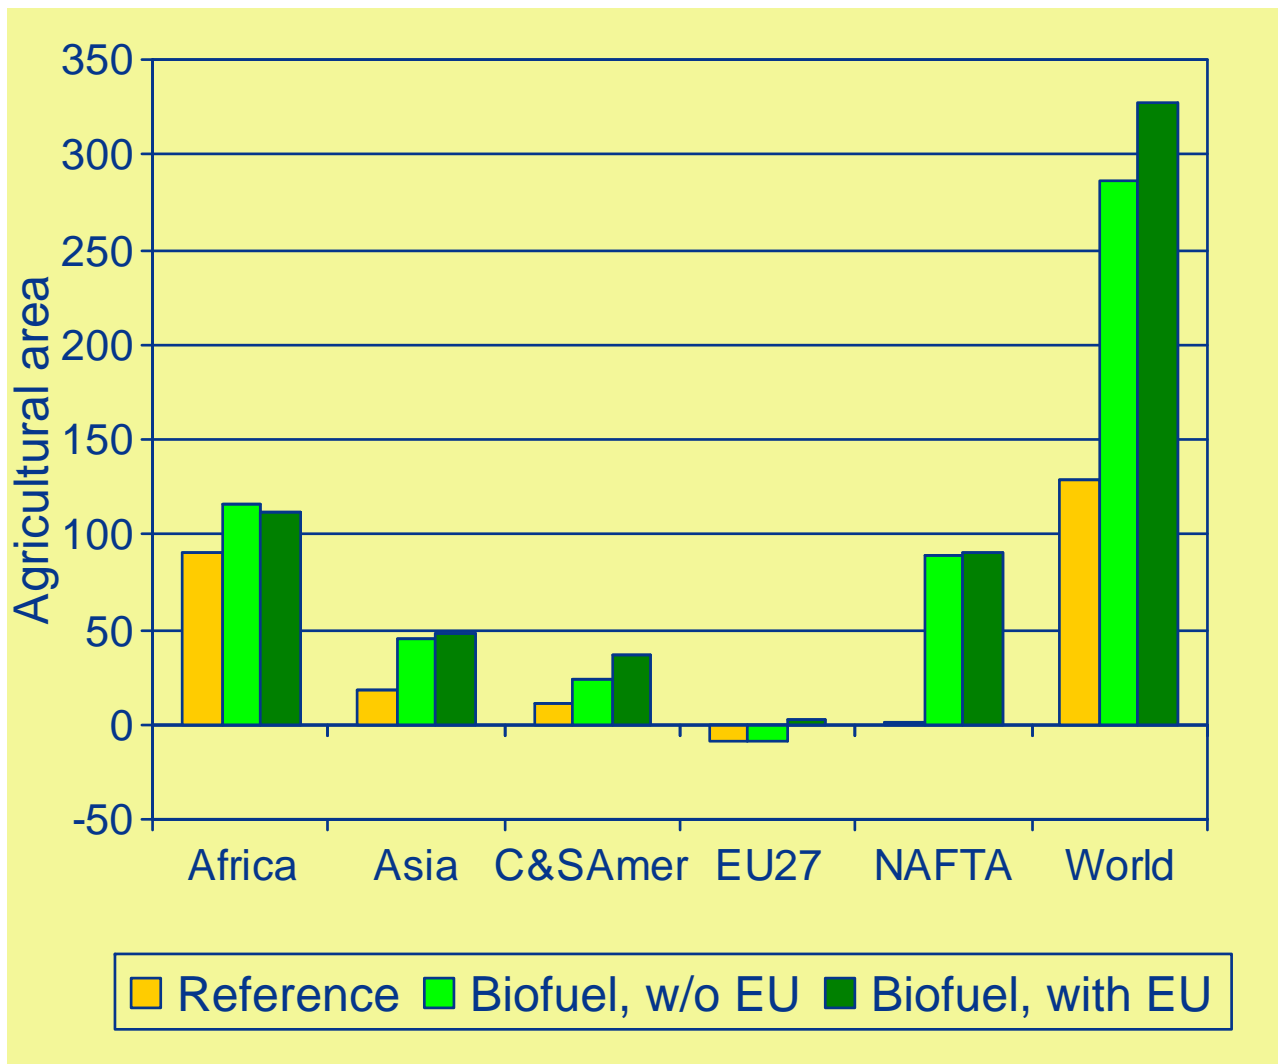

Forest transition: changing forest/population relations

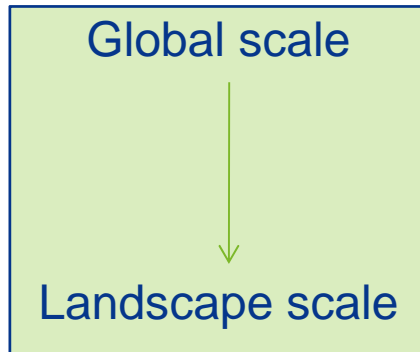

Market influence

Spatial trade-offs: a scenario study 2000-2030

Spatial trade-offs

Increased competitiveness of agriculture

Marginal areas:
Abandonment

Prime agricultural areas:
Intensification/scale enlargement

Land sparing
vs.
Land sharing

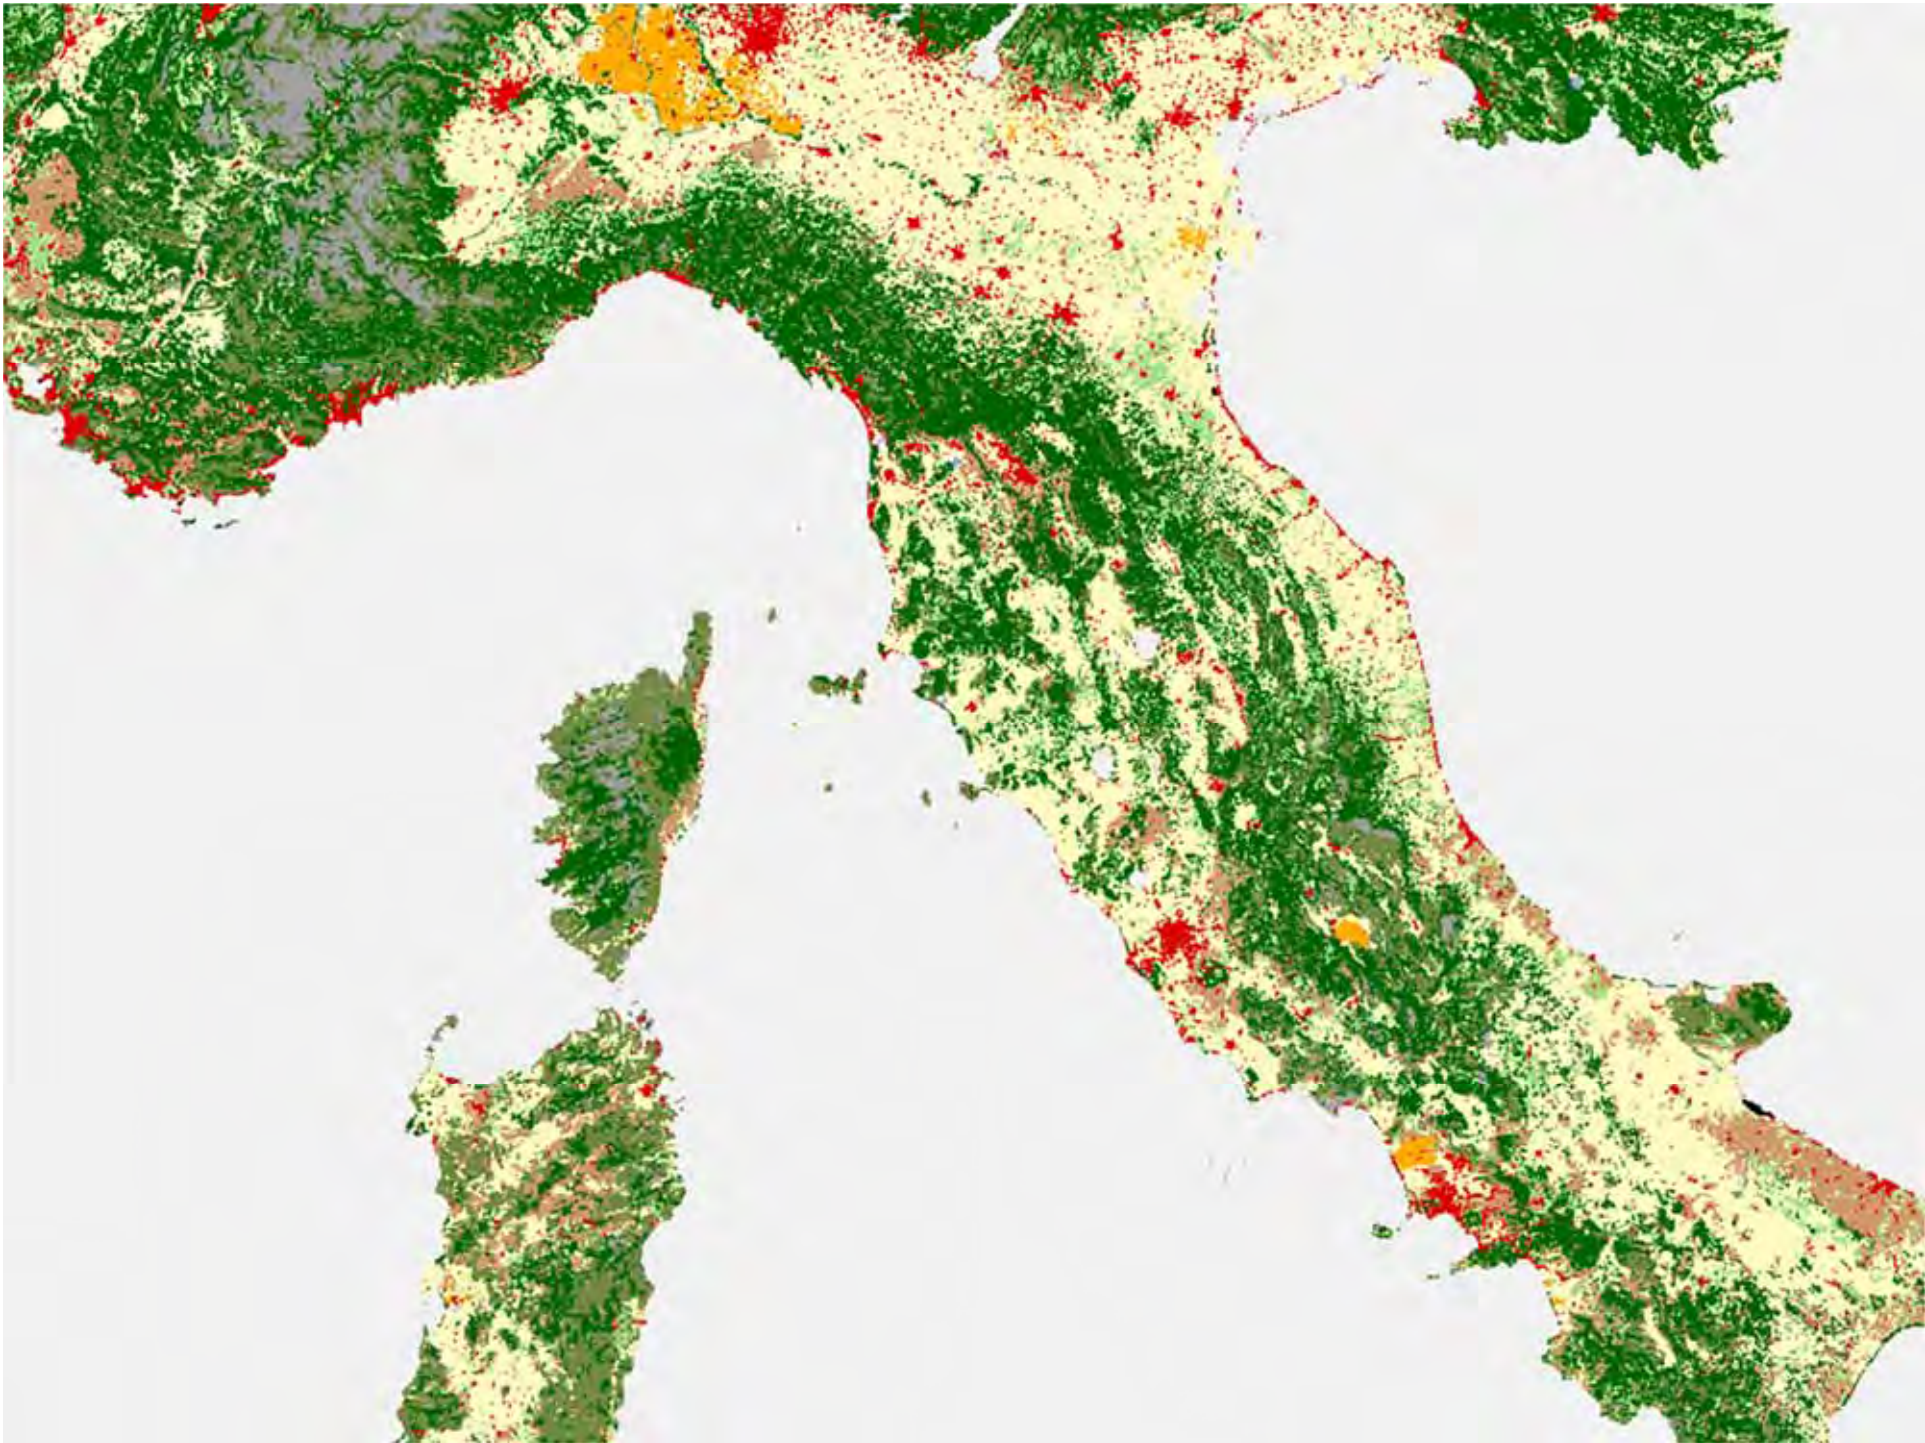

Land Sparing vs. Land Sharing

- Land sparing: human activities very intensive on ‘restricted’ area.
 - High impact on ecosystem services in affected area
 - Low impact on ecosystems in remaining area
 - ☹ Spatial/temporal spill-over / re-bounce effects
 - ☹ Not all ecosystem services can be ‘transported’

- Land sharing: multi-functional land use
 - Based on synergies in ecosystem service provision
 - Extensive land uses, requiring large areas
 - ☹ Large land requirements, no ‘wilderness’

A photograph of a herd of wild horses in a snowy, misty environment. The horses are dark brown and black, with some lighter patches. They are standing in a field of snow, and the background is a soft, hazy white. The overall mood is serene and wild.

HNV Farming & Biodiversity Panorama

Csik Mountains, Romania

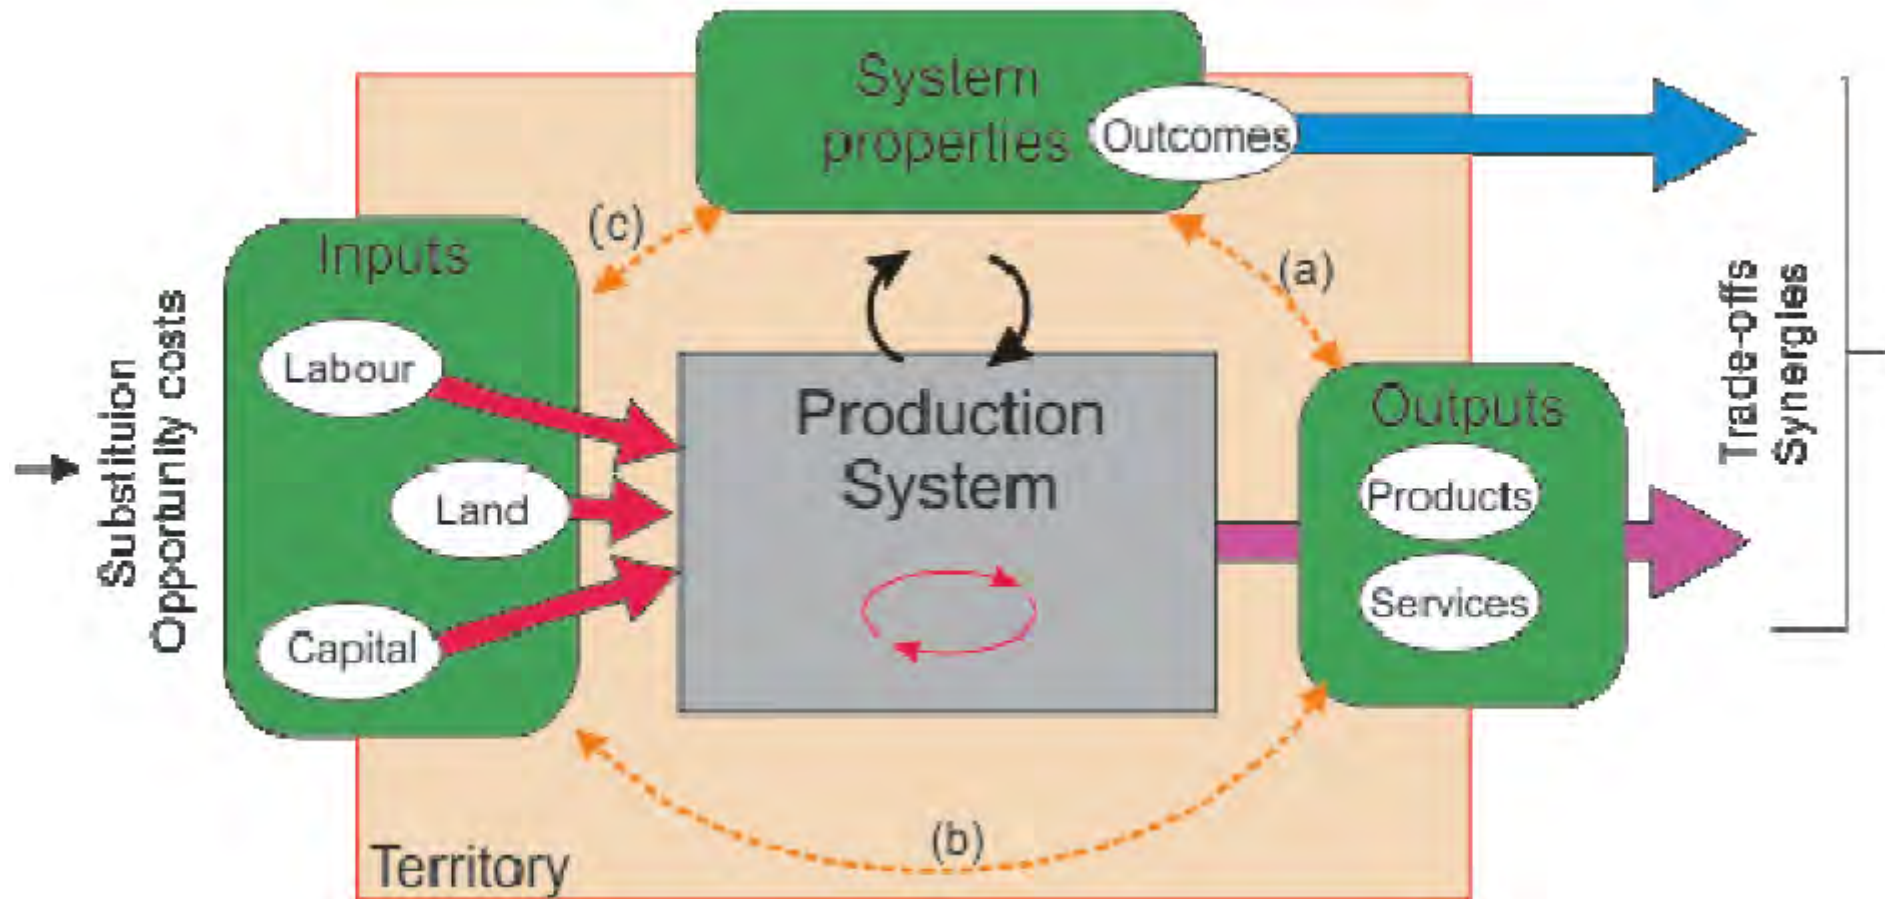

The name of the site is derived from a mountain basin of the Eastern Carpathians, called Csik Basin.

The basin got its name from the Weatherfish (*Misgurnus fossilis*) that was once very abundant in the floodplain marshes.

Model results

Lessons from historic land use analysis

- Large legacy effects
- Path dependence (e.g. cities)
- Large transitions have occurred due to changing human-environment interactions, fluctuations in land use
- Learn from areas with long-term sustainable production
- Telecoupling is not new (colonial period), but interactions are more intense and faster
- Demand for 'services' from the land is unprecedented
- Model predictions based on historic trends likely to be unrealistic

From land cover to land use to land function

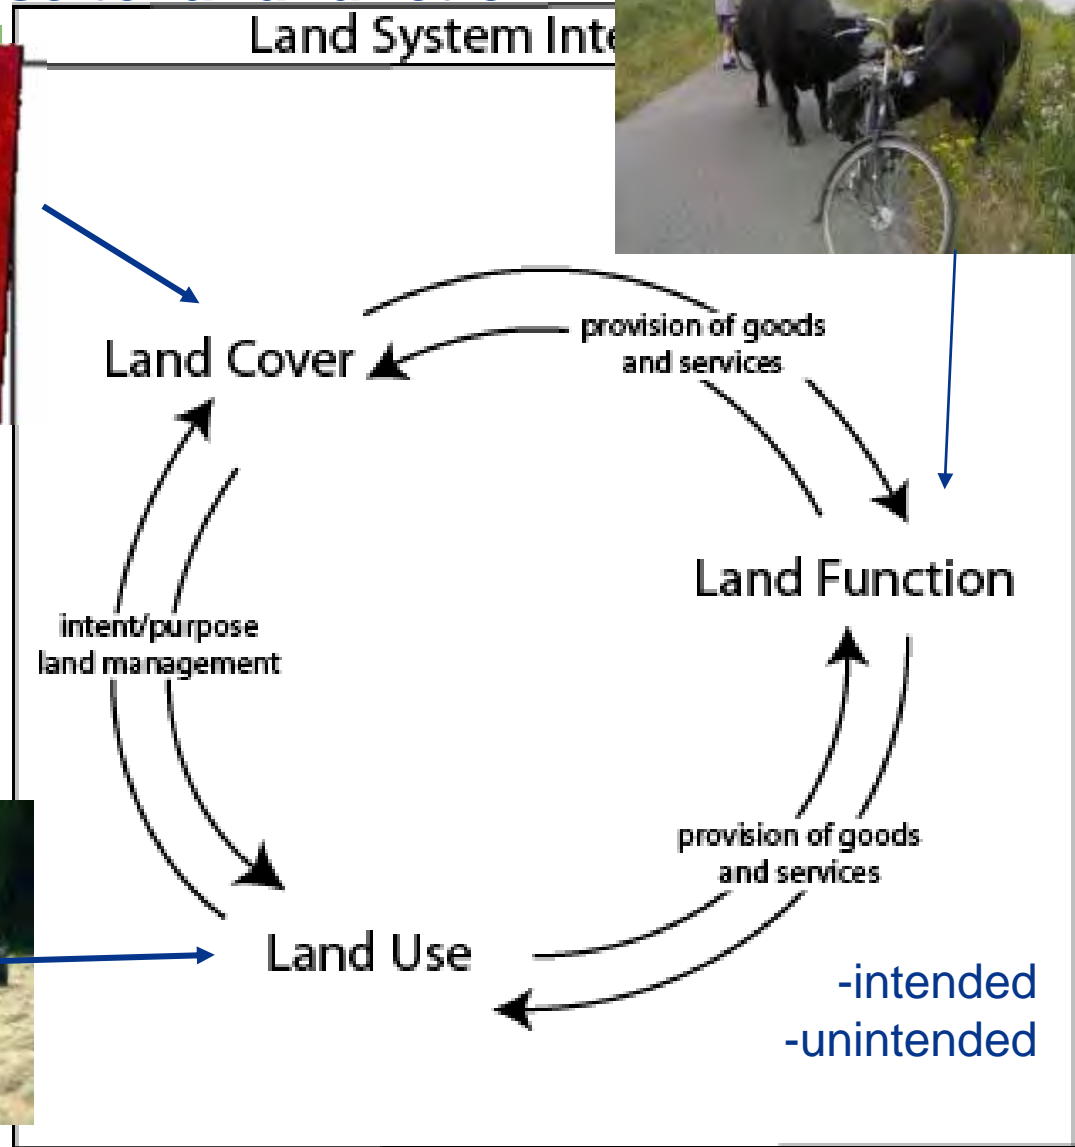

“Land cover can be a cause, constraint or consequence of land use”

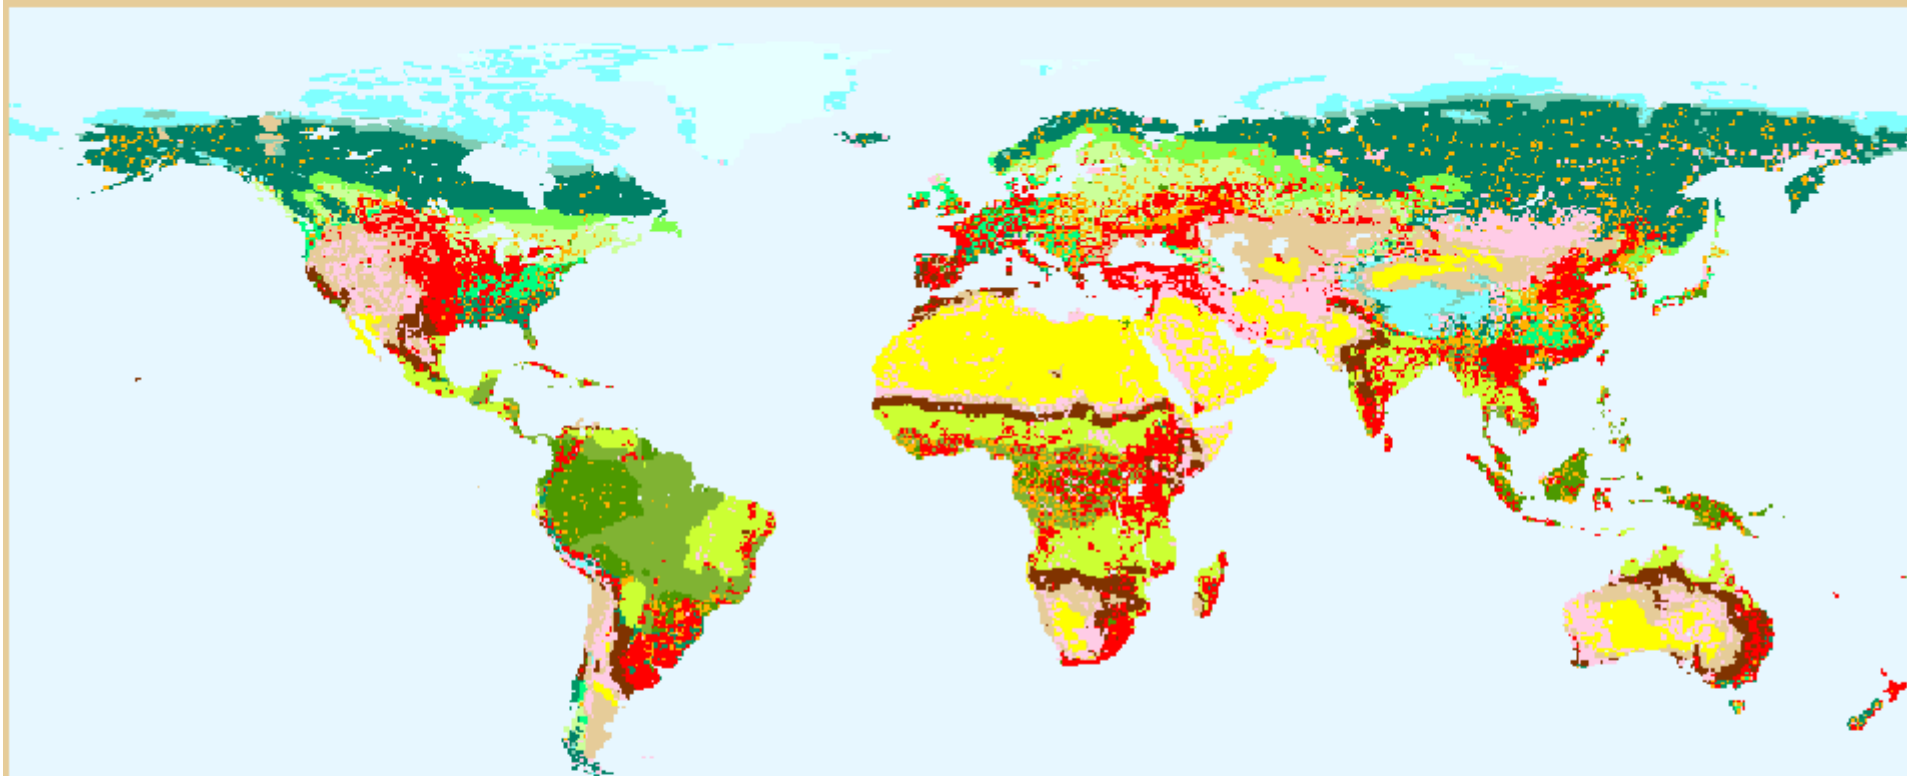

(Cihlar and Jansen, 2001)

Verburg et al., 2009 Journal of Environmental Management

-  Bare
-  Bare with few livestock

Settlement systems

-  Peri-urban and villages
-  Urban

Increase in crop production

Land change and sustainable development

Land change is a **CONSEQUENCE** of global change

Land change is a major **CAUSE** of global change

Land change is a possible **SOLUTION** to global change

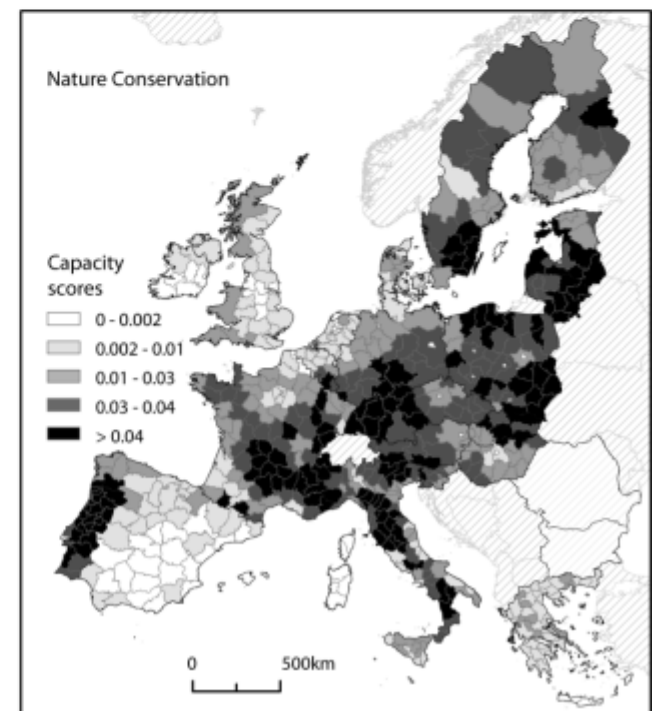

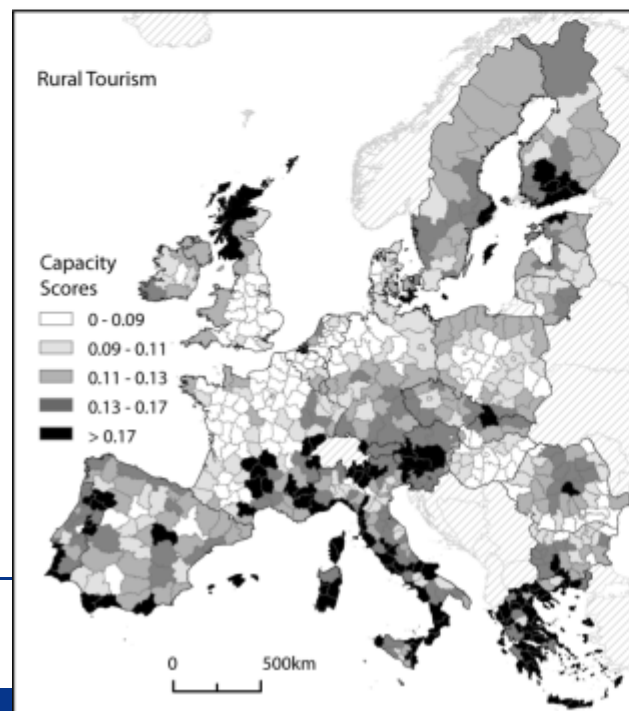

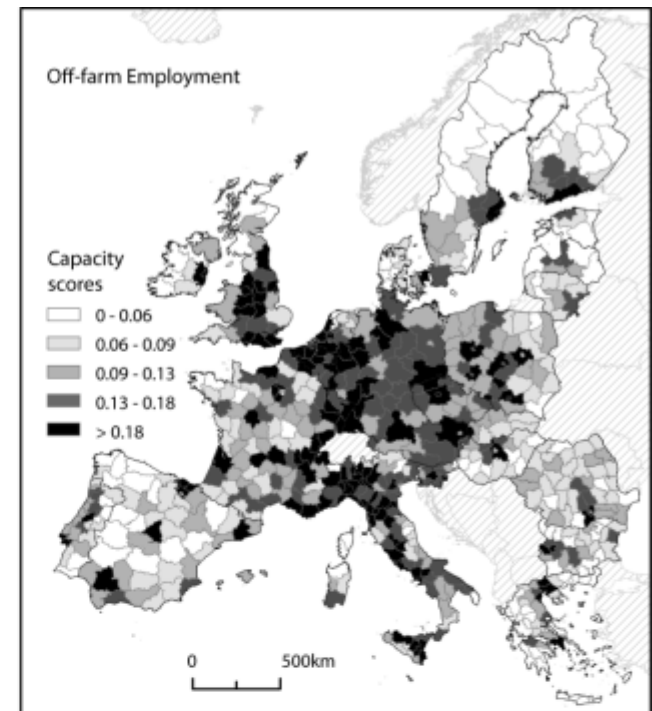

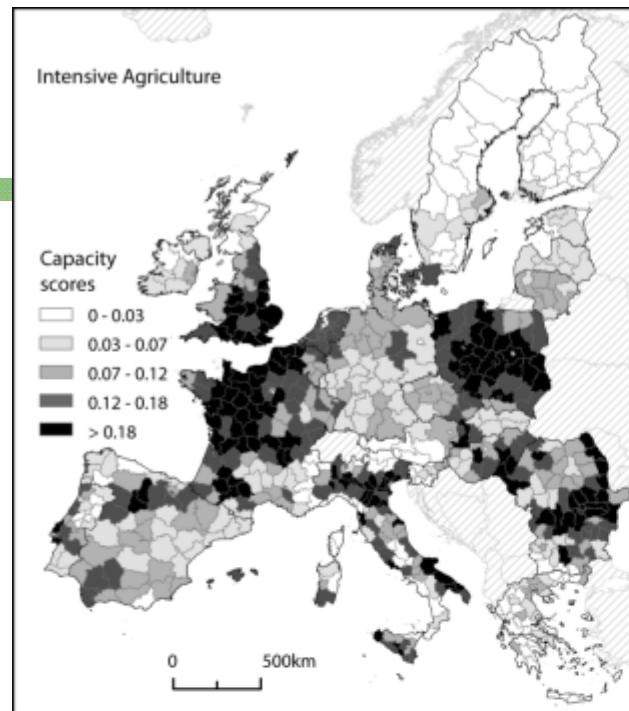

- Land governance
- Land system architecture

Rural development potentials

(Van Berkel and Verburg, Land use policy)

Baseline

New Communalism Scenario

Territorial Sustainability Scenario

Key messages

- Land change happens at the interface of the human and physical earth system
- Contextualized, place-based land governance solutions are needed to meet the sustainable development targets of the millenium development goals
- Local solutions adapted to the global context are needed
- Land science can act as a platform integrating research efforts, connecting different perspectives across scales
